Lab 7: UML Sequence Diagram and Activity Diagram

Aim: To represent the workflow and interactions between the candidate, application, AI service and database.

A. Sequence Diagram

This diagram explains what happens when a candidate starts a mock interview and receives feedback.

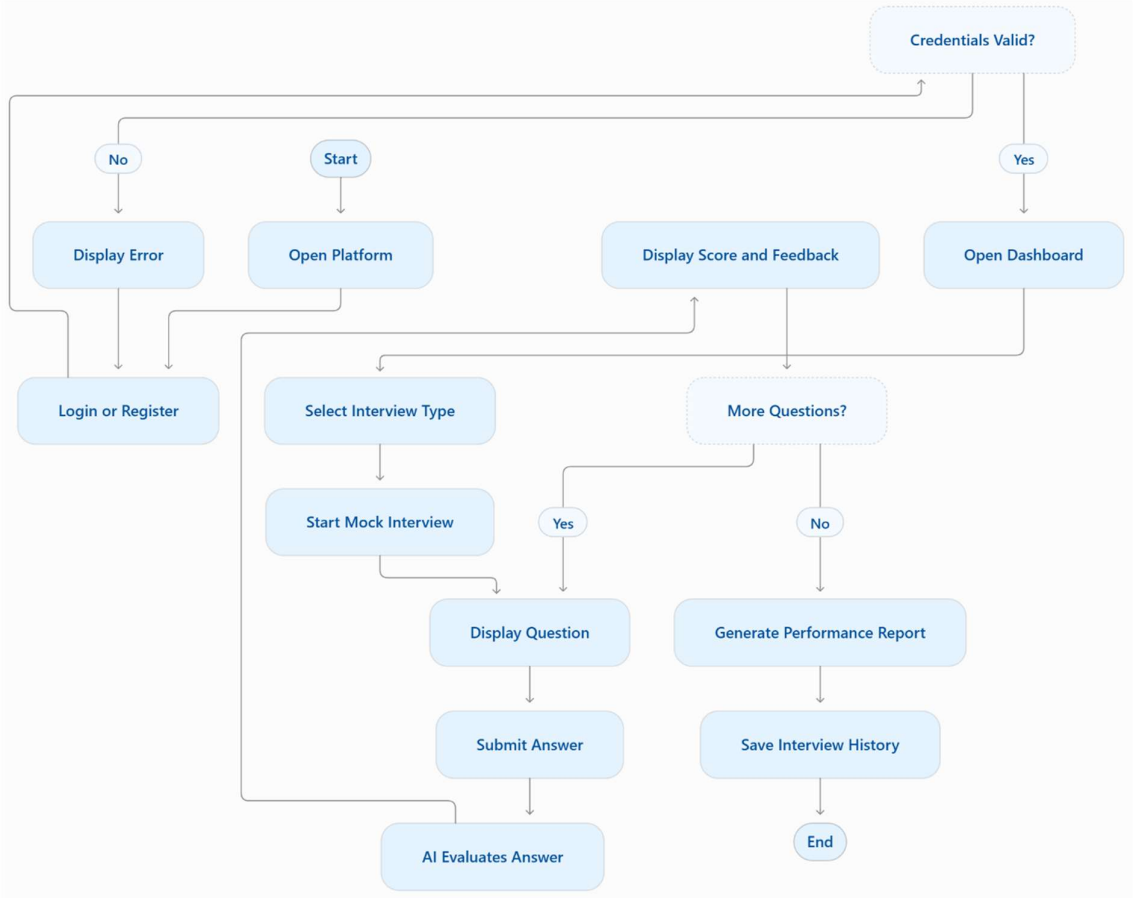

Explanation

1. The candidate logs into the platform.
2. The backend validates the credentials using the database.
3. A new mock interview session is created.

4. The AI service generates or retrieves an interview question.
5. The candidate submits an answer.
6. The AI service evaluates the answer and generates feedback.
7. The backend stores the result and displays feedback to the candidate.

B. Activity Diagram

Explanation

The activity starts when a candidate opens the platform. After successful authentication, the candidate selects an interview type and answers questions. The AI service evaluates each answer. The process repeats until the interview ends, after which a performance report is generated.

Result: The Sequence Diagram shows interactions over time, while the Activity Diagram shows the overall workflow and decision points.
